Ideation Phase

Brainstorm & Idea Prioritization

Date	21-10-2026
Team ID	23KD1A0571
Project Name	Employee Raise Issue – Record Producer & Service Portal Integration Guide
Maximum Marks	4 Marks

1. Introduction

The **Employee Raise Issue** project builds a guided issue-reporting solution on the ServiceNow platform. An employee opens a Service Portal, selects *Raise an Issue*, fills a catalog form (a Record Producer) and the platform creates a structured, auto-numbered record in a custom table. This document records the brainstorming that shaped the solution and the prioritization of the ideas by implementation effort.

2. Problem Identification

The problem context below is drawn from the outcomes the project set out to achieve (standardized and accurate submission, less manual effort, fewer data inconsistencies, better visibility).

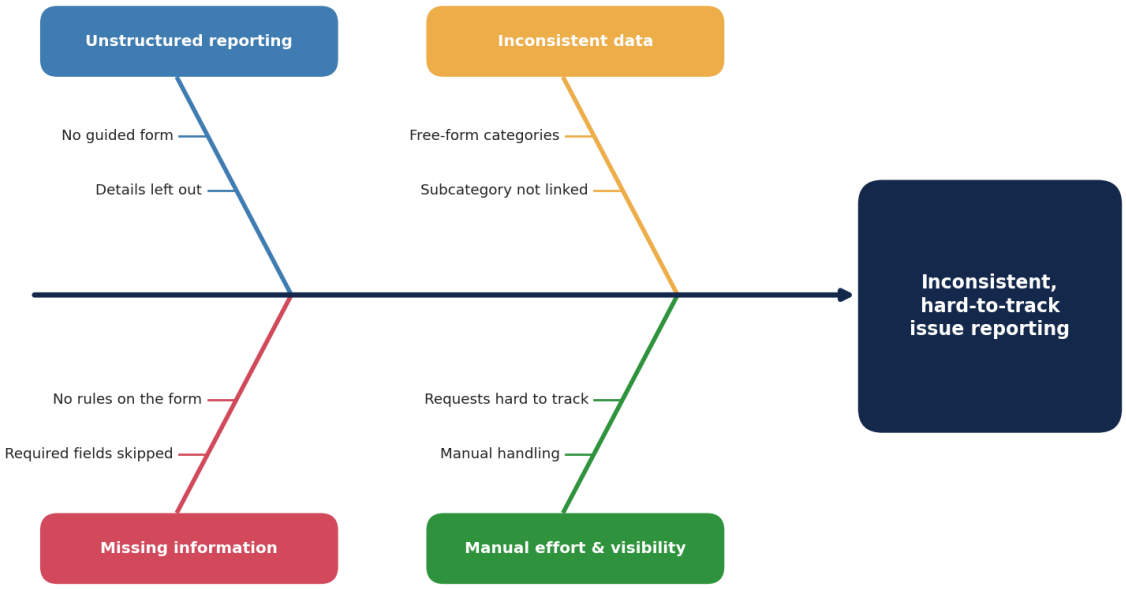

Figure 1.1 – Problem identification

Problem	Effect	Addressed by
Unstructured issue reporting	Incomplete or inaccurate issue details	Record Producer with guided variables
Free-form category entry	Inconsistent data across records	Choice fields and Category-based Subcategory dependency
Required details left blank	Records that cannot be understood or triaged	UI Policy: Short description mandatory
Manual handling of requests	Extra effort and slow resolution	Automatic record creation with auto-number
Limited visibility of requests	Poor tracking for employees	Service Portal with recent items and request tracking

3. Brainstormed Features

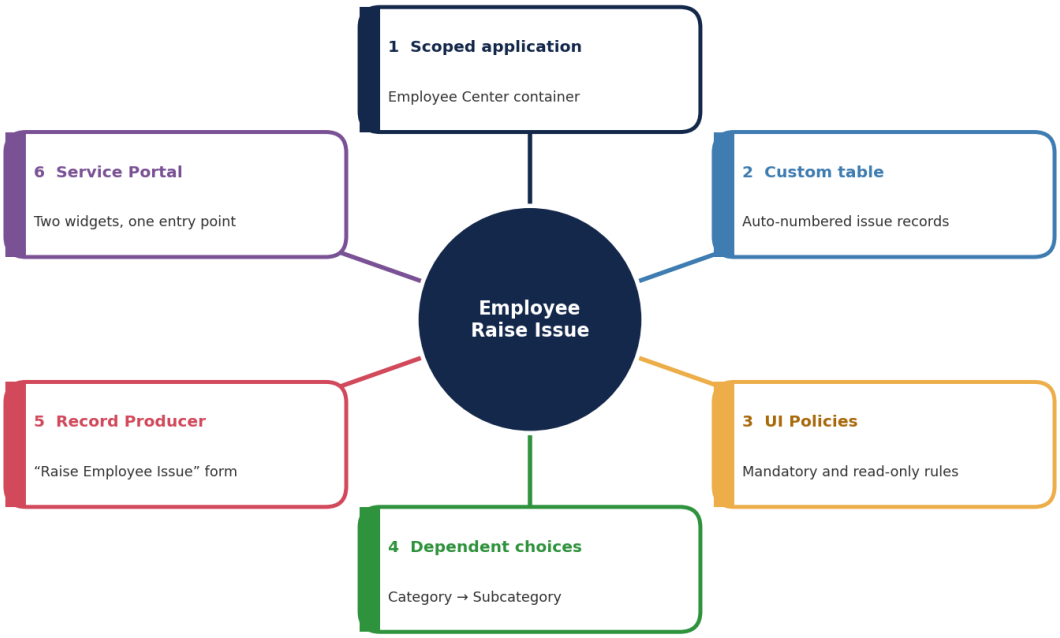

Figure 1.2 – Brainstormed ideas

Idea	Feature	ServiceNow component
Idea 1	Dedicated container for all project artefacts (name: Employee Center, scope: Scoped)	App Engine → ServiceNow Studio
Idea 2	Table "Employee raises issue" with Number, Requester, Category, Subcategory, Short description, State, Priority, Assignment group	System Definition → Tables, Form Design
Idea 3	Short description mandatory when State is New; Number field read-only	UI Policies and UI Policy Actions
Idea 4	Subcategory options limited by the selected Category	Dictionary → Dependent field and Choices
Idea 5	"Raise Employee Issue" form with 5 variables mapped to table fields	Service Catalog → Record Producer
Idea 6	Portal "Requesting portal" with a Commercial widget and a Raise-an-Issue link widget	Service Portal, Widget Editor, Designer

4. Key Objectives

- Standardize and improve the accuracy of issue submission.
- Enforce business rules (mandatory and read-only fields) through UI Policies.
- Control category and subcategory selection.
- Integrate the Service Portal seamlessly with the backend table.
- Improve visibility and speed up issue resolution.

5. Idea Prioritization – Implementation Map

Each idea was ranked by **effort**, measured with the task durations recorded in the project plan (minutes). The build order follows technical dependency: the application and table must exist before policies, the Record Producer and the portal can be created.

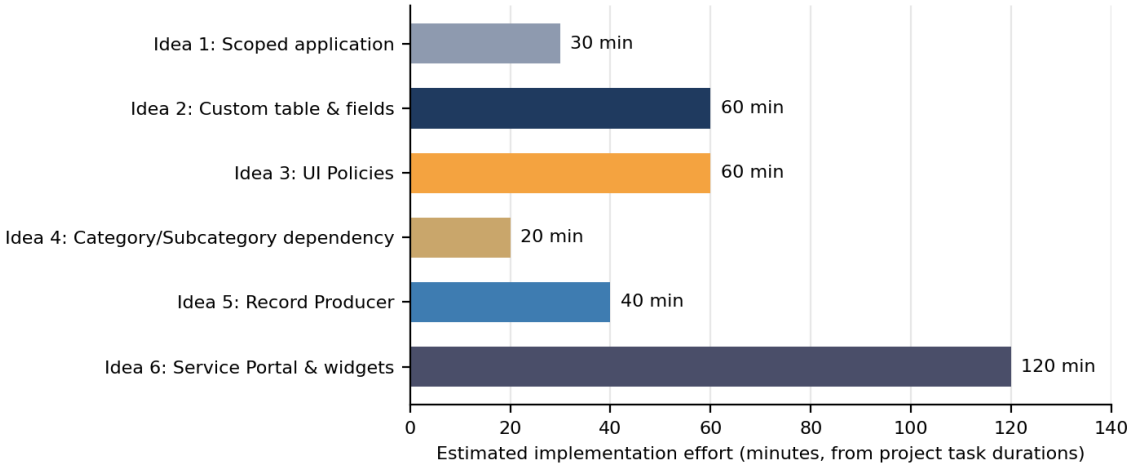

Figure 1.3 – Implementation effort per brainstormed idea

Build order	Idea	Effort	Effort level	Reason for position
1	Idea 1 – Scoped application	30 min	Low	Foundation; all other artefacts live inside it
2	Idea 2 – Custom table & fields	60 min	Medium	Data structure required by every later idea
3	Idea 3 – UI Policies	60 min	Medium	Needs the table fields (two policies, 30 min each)
4	Idea 4 – Dependency	20 min	Low	Needs the Category and Subcategory fields
5	Idea 5 – Record Producer	40 min	Medium	Maps variables onto the finished table
6	Idea 6 – Portal & widgets	120 min	High	Portal (15), page (15), two widgets (30 + 30), placement (30)

Effort level: Low ≤ 30 min, Medium 31–60 min, High > 60 min.

6. Selected Solution

All six ideas were selected for implementation. Together they form an end-to-end flow: **Service Portal → Record Producer → validated custom-table record**. The detailed requirements, design, plan, implementation and test results are covered in the subsequent phase documents.
