Project Design Phase-II

Solution Requirements (Functional & Non-functional)

Date	21-10-2026
Team ID	23KD1A0571
Project Name	Employee Raise Issue – Record Producer & Service Portal Integration Guide
Maximum Marks	4 Marks

Functional Requirements:

The functional requirements below describe what the Employee Raise Issue solution needs to do, grouped into six epics with the stories that make each one up.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	Application Setup	• Create a scoped application named Employee Center • Build and manage all artefacts from ServiceNow Studio
FR-2	Issue Data Management	• Create the custom table “Employee raises issue” • Generate an auto-number for every issue • Capture Requester, Category, Subcategory, Short description, State, Priority and Assignment group
FR-3	Form Rules and Validation	• Make Short description mandatory when State is New • Make the Number field read-only • Show Subcategory options based on the selected Category
FR-4	Issue Submission (Record Producer)	• Provide the “Raise Employee Issue” form in the Service Catalog • Collect requester, category, subcategory, state and short description • Map each variable to its table field • Create the issue record when the form is submitted
FR-5	Service Portal Setup	• Create the “Requesting portal” with the URL suffix employee_request • Create the Employee Center Portal Page • Apply the Employee Center menu and Coral theme
FR-6	Portal Widgets and Navigation	• Show a Commercial widget describing the service • Show a “Raise an Issue” widget with a Raise Ticket button • Open the Record Producer from the widget using its sys_id • Place both widgets side by side in a 6 | 6 container

Non-functional Requirements:

These requirements describe the qualities the solution should have while it does the work above.

NFR No.	Non-Functional Requirement	Description
NFR-1	Usability	Employees should be able to raise an issue easily, without technical knowledge, through a guided form with clear choices and a single Raise Ticket button on the portal.
NFR-2	Security	The portal should be reached through the platform’s login page over HTTPS, so that only signed-in users submit issues.
NFR-3	Reliability	Every submission should create a correct record with its own number, and the field rules and dependent choices should behave the same way each time.
NFR-4	Performance	The portal page, the form and the submission should respond within a few seconds so the experience stays smooth.
NFR-5	Availability	The portal should be available through its URL in a web browser whenever the ServiceNow instance is running.
NFR-6	Scalability	The solution should keep working as the number of users and issue records grows, and new category or subcategory choices should be easy to add to the choice lists.
