Project Design Phase
Proposed Solution Template

Date	21-10-2026
Team ID	23KD1A0571
Project Name	Employee Raise Issue – Record Producer & Service Portal Integration Guide
Maximum Marks	2 Marks

Proposed Solution :

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	When employees report IT issues without a guided form, the details that reach the support team are often incomplete, categories are entered in different ways and requests are hard to track. This adds manual effort and slows down resolution. The project aims to give employees one structured, trackable way to raise an issue.
2.	Idea / Solution description	Build an Employee Raise Issue solution on ServiceNow. Employees open the Requesting portal, use the Raise an Issue widget and fill in the Raise Employee Issue form (requester, category, subcategory, state and short description). The answers are saved as an auto-numbered record in a custom table, with UI Policies and dependent choices keeping the data consistent.
3.	Novelty / Uniqueness	The solution brings a scoped application, a custom table, UI Policies, a Category–Subcategory dependency, a Record Producer and a dedicated Service Portal together in one flow. Two custom widgets, one informative and one that opens the Record Producer through its sys_id, make the portal page the single starting point.
4.	Social Impact / Customer Satisfaction	Employees get a simple, guided way to raise an issue and a number to refer to afterwards. Standardized submissions, less manual effort and better visibility of requests improve the overall employee experience and help issues get resolved faster.
5.	Business Model (Revenue Model)	This is an internal solution for employees, so it is not built around revenue. Its value comes from reduced manual effort, fewer data inconsistencies and faster issue resolution for the organization.
6.	Scalability of the Solution	The solution is built on the ServiceNow platform and can be extended step by step: new categories, subcategories and states can be added to the choice lists, more fields can be added to the table, and more widgets can be placed on the portal page.
