Project Name	Employee Raise Issue – Record Producer & Service Portal Integration Guide
Maximum Marks	2 Marks

Solution Fit:

The Employee Raise Issue solution, built on the ServiceNow platform, gives employees a guided way to report an IT issue instead of describing it informally. An employee opens the Requesting portal, uses the *Raise an Issue* widget and lands on the *Raise Employee Issue* form in the Service Catalog. There the requester, category, subcategory, state and short description are filled in using clear choices.

What the employee enters is mapped straight into a custom table, and every submission gets its own auto-generated number. A few simple rules keep the records clean: the short description becomes mandatory when the state is New, the number field cannot be edited, and the subcategory options follow the category that was picked. This cuts down manual effort and keeps the data consistent from the first step.

All of this sits inside one scoped application, Employee Center, and the portal reuses the Employee Center theme and menu, with two widgets as the starting point. In this way each problem an employee faces when raising an issue has a matching part in the solution, which supports standardized submission, better visibility and faster resolution.
