Project Name	Employee Raise Issue – Record Producer & Service Portal Integration Guide
Maximum Marks	2 Marks

Customer Problem Statement:

In most workplaces, an employee who runs into an IT problem such as a network issue, a faulty laptop, a software error or a lost login has to explain it to someone and hope the right details get across. When there is no proper form behind the process, the information that reaches the support team is often incomplete, the same kind of problem gets described in different ways, and the person raising it has little idea what happens next. All of this takes extra manual effort and slows down the resolution.

Without a single, structured place to raise issues, it is also hard to keep the data clean. Categories and subcategories are entered freely, important fields get skipped, and there is no easy way for an employee to see their request or for the team to track it. This shows the need for a simple, guided way of submitting issues that keeps the data consistent from the very first step.

This project tackles that using ServiceNow. A custom scoped application holds a custom table where every issue is stored with its own auto-generated number. Employees raise an issue through a Record Producer named *Raise Employee Issue*, which collects the requester, category, subcategory, state and short description. UI Policies make the short description mandatory and keep the number field read-only, and the subcategory choices depend on the category selected. A dedicated Service Portal, with a *Raise an Issue* widget, takes the employee straight to the form. The aim is to standardize issue submission, cut down manual effort and improve the overall employee experience.
