Project Name	Employee Raise Issue – Record Producer & Service Portal Integration Guide
Maximum Marks	4 Marks

Solution Architecture:

The Employee Raise Issue solution is built on the ServiceNow platform in three layers. Employees reach the system through the Requesting portal, where a *Raise an Issue* widget takes them to the *Raise Employee Issue* form. The form's variables are mapped to the fields of a custom table, the form rules keep the values consistent, and each issue is saved with its own auto-generated number. All of it is kept together in the scoped application *Employee Center*.

- **User Interaction Layer:** The Service Portal page with the Commercial widget and the Raise an Issue widget, and the Record Producer form in the Service Catalog, where the employee enters the requester, category, subcategory, state and short description.
- **Business Logic Layer:** A client controller that opens the Record Producer using its sys_id, the Map to Field settings that carry the five variables into the table, two UI Policies (Short description mandatory when State is New, Number read-only) and the dictionary dependency that limits Subcategory by Category.
- **Data & Service Layer:** The custom table "Employee raises issue" with auto-number, the sys_user and sys_user_group tables used for Requester and Assignment group, and the scoped application on the ServiceNow developer instance.
